IQly · Why This Flow

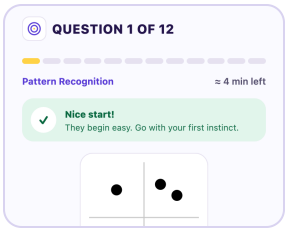

Moshe Bajayo
November 7, 2026

Goal: maximize account creations ÷ page visits for cold "free iq test" Search traffic with zero trust in IQly.

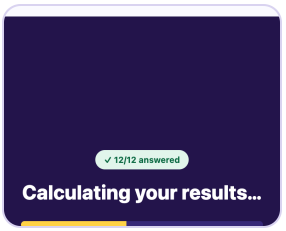

What I built: five screens, one doubt answered on each

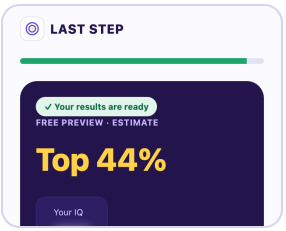

1 · Landing
Is it really free? → "Free" in the headline.

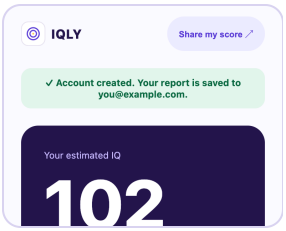

2 · Quiz
Will it drag? → Progress bar, minutes left.

3 · Analyzing
Is it real scoring? → Visible scoring steps.

4 · Gate
What's the catch? → Free percentile first.

5 · Results
Was it worth it? → Score and a challenge.

Three big bets

GATE

Free percentile, exact score for an email, on one screen

I chose one merged screen over a teaser plus a signup, assuming each extra tap loses visitors. The free percentile gives value before the ask. Cost: no standalone score reveal.

Moves gate → signup. Part 2, variant 3 tests it.

LENGTH

12 questions, not 20

I assumed, without measuring, that completion falls as length grows. Twelve items still span all four reasoning types. Cost: a noisier score, so every score is labelled an estimate.

Moves quiz start → complete. Part 2, variants 1–2 target this step.

CONTINUITY

The hero is the real Question 1, and the ads repeat the landing

A visitor who clicked "What's your IQ?" sees the same words and the quiz itself at once. A "Free IQ Test" tag stays for Search match. Cost: ads must change whenever the landing does.

Moves landing → quiz start.

Other decisions

No visible timer in control. A countdown adds anxiety for cold traffic; Part 2 tests it.

"An estimated X% of people." There is no real test-taker population yet, so I claim no measured data.

Honest by construction. No fake stats or reviews; every colour pair is contrast-checked.

Google + email signup. One tap removes typing. Google is a labelled prototype demo; production uses Google Identity Services.

"Challenge a Friend" after signup. A growth loop that brings the next visitor in, not a CVR lever.

One reversal: my first hypothesis had an undisclosed mock Google button. I cut it, then restored it as a labelled demo.

What I'd watch in week 1

page_view → quiz_start	quiz_start → quiz_complete	Drop-off by question, by device	gate_view → signup_success	Overall CVR
Below baseline: rework the hero.	Below baseline: cut to 8–10 items.	One question spikes: rewrite that item.	Below baseline: test a different gate.	The goal. Falls anywhere: find the leak above.

No traffic yet, so week 1 sets the baselines and nothing here is a measured number. The biggest leak becomes the next test.

How I built it

- I designed the funnel in Claude Design and built it in Claude Code with a custom toolkit: **5 skills** (quiz builder, CRO audit, A/B designer, creative builder, automated QA) and **5 agents** (4 visitor personas, 1 hiring-manager reviewer).
- **The loop:** build → automated QA at 390 and 1440px → CRO audit and persona reviews → fix → re-verify.
- **AI caught a real issue.** The mobile persona quit when answer options ran off a 390×664 screen. Screenshots confirmed it on questions 3 and 7; after my layout fix, all 4 options fit on screen.
- **I overrode the AI.** Its first plan hid the speed bonus from visitors. I required it to be disclosed, so the quiz says "speed counts a little."

Full log: ai-log.md. See "Part 1 design plan approved" and "Persona reviews surfaced 2 real defects, both fixed."
